

SERVICE INSTRUCTION

APPLICATION OF QH-130 SEALANT

The logo for DeVilbiss, featuring the brand name in a bold, italicized, sans-serif font with a registered trademark symbol, set against a solid black rectangular background.

To assure successful application of QH-130 anaerobic sealant, please read the following information.

Some surface finishes, namely chrome, cadmium, zinc, anodized aluminum and many hardening processes are classified as “inactive” and require 72 to 96 hours curing time unless activated with a primer prior to application.

Properly prepare the surface by cleaning it with an anaerobic primer. The primer activates the surface to reduce the curing time and also removes oil or grease residue. Primed surfaces will allow the sealant to fully harden in 24 hours or less depending on the surface finish. Allow 24 hours of curing time for the primed surfaces.

Check the Yellow Pages under Industrial Equipment Suppliers or Adhesives and Glues to locate a source of primer for anaerobic sealants. A Safety Data Sheet is available upon request from DeVilbiss.
